CC genes. AAY36724 to AAY36727 represent the secreted protein cycles. AAY36724 to AAY36727 represent the secreted proteins encoded by chaptering genes. The genes and their corresponding secreted cyclypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a cycle can be diagnosed by determining the amount of the new polypeptides in a cycle can be diagnosed by determining the presence of mutations in the new genes. This GA binding protein (GABP) consists of two separable subunits. Applicants have isolated cDNA clones encoding both subunits of GABP and have revealed that one (GABP alpha) is related to the Ets series of 33-amino acid repeats related in sequence to a variety

                                                                                                                                                                                                                                                                                                                                                                                                                 mammalian cells by administering a peptide that binds the insulin receptor (IR). A composition containing a peptide, optionally expressed from gene therapy vectors, that binds to Site 1 of IR and an insulin agonist are useful for treating diabetes. Also, peptides that are useful for treating diabetes. Also, peptides that are useful for treating diabetes. Also, peptides that are useful for treating agrowth factor (IGF-1) receptor are useful for treating insulin-like growth factor (IGF)-sensitive tumours (e.g. of prostate and breast) and diabetic retinopathy, while IGF-1 receptor agonists are useful for treating neurological diseases, including stroke and diabetic neuropathy. The peptides are also useful therapeutics and research reagents. AAU88034-AAU90957 represent IR and/or IGF-1 receptor-binding peptides and related amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; antidiabetic; neuroprotective; cerebroprotective; ophthalmological; insulin; receptor; gene therapy; diabetes; insulin-like growth factor-1; IGF-1; tumour; prostate; breast; insulin-tic retinopathy; neurological diseases; stroke;

Labelled functional surrogate of an analyte - useful as competitor molecule in affinity assays, esp. for detecting large macromolecules ferritin

WPI; 1997-077284/07

Claim Page 95; 156pp; English.

This sequence represents a monoclonal anti-hepatitis B antigen binder consequence from the R26 library which may be used in the conjugate of the convention. The novel labelled conjugate comprises at least one label cattached to a functional surrogate comprises at least one label cattached to a functional surrogate of an analyte of interest. The conjugate is capable of competing effectively with the analyte for a climiting amount of an affinity receptor for the analyte. The conjugate comprists an activity that is altered upon interaction with the affinity receptor and this activity can be measured and related to the amount of the analyte present in a sample. Functional surrogates such as this have an immunoreactive group that allows the surrogate to compete effectively and with the analyte for a limiting amount of its affinity receptor. They can be labelled for use in standard competitive affinity assays (esp. homogenous immunoassays) for detecting large macromolecules such as polypeptides, polysaccharides, polynucleotides, glycoproteins and competitive analytes for detection include cardiac or tumour markers, allergens, hormones related to fertility-pregnancy or analytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, follicle stimulating hormone, human placental confortion gonadotropin, human luteinisting hormone, human placental confortions gonadotropin, human luteinisting hormone, cytomegalovirus, DK.MB. Chlamydia, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, myoglobin, myosin light chain, troponin, carcinoembryonic antigen, alpha-fetoprotein, prostate-specific antigen and CA125 (a tumour mar) (a tumour marker).

              Clostridium perfringens food poisoning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of the blood coagulation cascade. The anticoagulant activity is not inhibited by serine protease inhibitors such as PMFS or DFP. The molecular weight of Draculin ranges from 75-90 kD and may be used in treatment of acute myocardial infarction, deep vein thrombosis, pulmonary embolism, unstable angina, transient ischemic attacks, peripheral vascular or bypass occlusions and disseminated intravascular coagluation. These peptide fragments were derived from Draculin by cleavage with chymotrypsin and overlapping peptide fragments were compared to determine the complete amino acid sequence of Draculin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence corresponds to a carboxy-terminal protein fragment (amino acid residues 290-319) of the Clostridium perfringens type A enterotoxin protein. Plasmids containing E. coli expression vectors and Clostridium perfringens type A enterotoxin gene fragment encoding amino acid residues 171-319 or 290-319 can be used to produce Clostridium perfringens type A enterotoxin toxoids. A synthetic peptide corresponding to these residues 290-319 can also be prepared to be used as a toxoid. These toxoids irreversibly bind to and saturate receptor sites on intestinal membranes, thus effectively competing for these receptor sites with Clostridium perfringens type A enterotoxin. The synthetic peptide and the recombinant carboxy-terminal fragment, are useful as toxoids in a vaccine for preventing C. perfringens food poisoning, or in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of a D3 peptide derived from human high mol.wt. kiningen (HK) domain 3 (see AAY95426). The D3 peptide inhibits endothelial cell proliferation and thus possesses anti-anglogenic activity. It is an example of D3 peptides of the invention (see AAY95405-26) that are analogues of certain sites in the HK domain 3, in this case amino acid residues Leu331-Tyr338, where native cysteine residues may be replaced by alanine residues. The peptides inhibit endothelial cell proliferation and may also induce endothelial cell apoptosis. Compositions including the peptides are used in claimed methods for inhibiting angiogenesis, inhibiting endothelial cell proliferation, and inducing endothelial cell apoptosis. Cancer, rheumatoid arthritis, and ocular disorders characterized by undesired vascularization of the retina are treated.
                                                                                                                                                                                                                                                     Functional surrogate; analyte; affinity receptor; immunoreactive group; mimic; homogenous immunoassay; detection; diagnostic analyte; Chlamydia; cardiac marker; tumour marker; allergen; hormone; fertility; myoglobin; pregnancy; infectious disease; ferritin; myosin light chain; troponin; follicle stimulating hormone; human; growth hormone; immunoglobulin E; prolactin; parathyroid hormone; placental lactogen; hepatitis antigen; antibody; chorionic gonadotropin; luteinising hormone; cytomegalovirus; streptococcus; rubella; toxoplasma; DK-MB; prostate-specific antigen; carcinoembryonic antigen; alpha-fetoprotein; herpes virus; CA125.

CC limiting amount of an affinity receptor for the analyte. The conjugate CC exhibits an activity that is altered upon interaction with the affinity receptor and this activity can be measured and related to the amount of the analyte present in a sample. Functional surrogates such as this have CC an immunoreactive group that allows the surrogate to compete effectively and with the analyte for a limiting amount of its affinity receptor. CC Functional surrogates are able to mimic naturally occurring analytes. CC (esp. homogenous immunoassays) for detecting large macromolecules such CC as polypeptides, polypactoles, as well as small haptens. Typical CC diagnostic analytes for detection include cardiac or tumour markers, CC allergens, hormones related to fertility-pregnancy or analytes associated with infectious disease. In particular, the assays are useful for CC detecting ferrith, follicle stimulating hormone, human growth hormone, immunoglobulin E, prolactin, parathyroid hormone, human growth hormone, CC chamoglobulin E, prolactin, parathyroid hormone, cytomegalovirus, CC chamydia, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, CC alpha-fetoprotein, prostate-specific antigen and CA125 (a tumour marker).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                           Score
